2V0-33.22PSE Exam

VMware Cloud Professional Exam

Exam Latest Version: 9.2

Question 1. (Single Select)

A cloud administrator is trying to increase the disk size of a virtual machine (VM) within a VMware Cloud solution. The VM is on a datastore with sufficient space, but they are unable to complete the task.

Which file is preventing the administrator from completing this task?

- A: The .nvram file
- B: The .vmtx file
- C: The .vmdk file
- D: The .vmsn file

Correct Answer: D

Explanation:

.vmsn (VMware Snapshot State File): This file stores the state of a virtual machine's memory and running processes when a snapshot is taken. The presence of a .vmsn file indicates that the VM has an active snapshot. Snapshots essentially "freeze" the virtual disk (.vmdk) configuration, preventing changes like disk expansion.

Question 2. (Multi Select)

A customer needs to set up a self-managed VDI solution that can be deployed to any VMware Cloud. Which two VMware solutions can meet this requirement?

- A: VMware Dynamic Environment Manager (DEM)
- B: VMware ThinApp
- C: VMware Workspace ONE Unified Endpoint Management (UEM)
- D: VMware Horizon
- E: VMware Workspace ONE Access

Correct Answer: D, E

Explanation:

The two VMware solutions that can meet the customer's requirement for a self-managed VDI solution are D. VMware Horizon and E. VMware Workspace ONE Access. VMware Horizon is a virtual desktop and application virtualization platform that enables customers to set up and deploy a virtual desktop infrastructure in any cloud environment. VMware Workspace ONE Access provides secure access to applications, data, and devices in any cloud environment.

Question 3. (Single Select)

A cloud administrator is notified by VMware that their VMware Cloud on AWS Instance will be updated in seven days. Which action does the cloud administrator need to take to allow the update?

- A: Add capacity.
- B: Select a date for the upgrade.
- C: Respond to the notification.
- D: Nothing needs to be done.

Correct Answer: D

Explanation:

VMware Cloud on AWS is a managed service, and VMware handles the updates and patches to the infrastructure. When VMware notifies customers of upcoming maintenance or updates, it is usually for informational purposes, so the customer is aware. Unless there's a specific action item mentioned in the notification (which would be unusual), no action is required from the customer's end.

Upgrades for VMware Cloud on AWS SDDCs are deployed in a rollout across the service. When an upgrade rollout is available for your organization, you receive an email notification and a notification in the VMware Cloud Console. Typically, you receive this notification 30 to 60 days before upgrades begin for a rollout. After you receive the notification, you can submit a scheduling request for any of your SDDCs. So respond is required for initial schedule. If you receive the notification 7 days before start, this means you already responded to the proposed date and agree on it. <https://docs.vmware.com/en/VMware-Cloud-on-AWS/services/com.vmware.vmc-aws-operations/GUID-EE89B216-BE93-4A1A-9280-8F20E2A5266F.html> <https://docs.vmw>

Question 4. (Single Select)

If a company connects their data center to a VMware Cloud on AWS software-defined data center (SDDC) Instance through a virtual private network (VPN) and advertises a 0.0.0.0/0 route, what is the expected behavior of the SDDC compute network traffic?

- A: All compute and management traffic will egress to the data center.
- B: All compute network traffic destined for the data center will egress through the VPN but all Internet traffic will egress through the cloud provider Internet gateway.
- C: All compute network traffic will egress through the cloud provider Internet gateway.
- D: All compute network traffic will egress to the data center.

Correct Answer: D

Explanation:

When a VPN is established between the data center and the SDDC Instance, it allows the organization to create a private and secure connection between their on-premises infrastructure and their workloads running in the cloud. By advertising a 0.0.0.0/0 route, the organization is essentially routing all traffic to the VPN tunnel, which means that all traffic including traffic destined for the data center and internet traffic, will be sent through the VPN tunnel to the company's data center.

It is important to note that this configuration depends on the company's network architecture and security policies, and that there may be other alternatives that better fit the organization's needs.

Question 5. (Multi Select)

What are two key benefits of VMware's partnerships with hyperscalers?

- A: Access to native public cloud services
- B: Automation of infrastructure operations in a single view
- C: Seamless workload migration across clouds
- D: One-click conversion to cloud native services
- E: Elimination of egress costs

Correct Answer: B, C
