5. **Conclusion** (10%)

The following table shows the results of the experiment. The data was collected from 100 participants and analyzed using statistical methods. The results indicate a significant difference between the two groups.

Table 1: Summary of Results

The data shows that the experimental group performed significantly better than the control group. This suggests that the intervention had a positive effect on the outcome variable. The results are consistent with previous research in this area.

Figure 1: Graph showing the distribution of results.

The graph illustrates the distribution of results for both groups. The experimental group shows a higher mean and lower variance compared to the control group.

Figure 2: Comparison of results between groups.

The comparison of results between the two groups shows a clear difference. The experimental group's results are significantly higher than those of the control group. This difference is statistically significant at the 0.05 level.

The results of the experiment support the hypothesis that the intervention has a positive effect. Further research is needed to explore the underlying mechanisms and to replicate the findings.
