Question 1. (Single Select)

An Architect has been asked by the Business to integrate a newpayment LINK cartridge. As part of the integration, the Architect has created four new services to access various endpoints in the integration.

How can the Architect move the new services to Production when the integration is ready for launch?

A: The new services will be moved to Production with a Data Replication.

B: The new services will be moved to production with a Site Import.

C: The new services must be manually exported from staging and Imported into Production.

D: The new services will be moved to Production with a Code Replication.

Correct Answer: D

Explanation:

For deploying new services related to a payment LINK cartridge to Production, the correct method is through Code Replication (D). This approach ensures that all new code changes, including the integration services, are consistently applied across different environments. Code replication covers deploying all changes made in code, scripts, and service configurations from a staging or development environment to the production environment. This process ensures that all new functionalities are tested in a controlled environment before being moved to production, reducing the risk of errors affecting the live site.

Question 2. (Multi Select)

A client has just pushed a new site live to Production. However during smoketesting. It's found that some customers are not seeing the correct pricing on the Product Detail Page.

What three places would the Architect begin to look for the cause of this Issue?

Choose 3 answers

- A: Check Log Center
- B: Check the Quota Status page.
- C: Check the Global Preferences to be sure the settings are correct.
- D: Check that there was not an error during replication.
- E: Check that the cache is set correctly

Correct Answer: C, D, E

Explanation:

To resolve issues where some customers are not seeing the correct pricing on the Product Detail Page, the following places should be examined:

Global Preferences (C): It's critical to check the global preferences settings to ensure they align with the intended pricing strategy and configurations. This includes checking currency settings, pricing rules, and tax configurations, which can all influence the pricing displayed to customers.

Error during replication (D): If there were errors during data replication, this could lead to inconsistencies such as incorrect pricing being shown. Ensuring that data has been replicated correctly and without errors is essential, particularly when moving from staging to production environments.

Cache settings (E): Incorrect cache settings or outdated cached data can cause old or incorrect pricing to be displayed. Clearing the cache or verifying that cache invalidation rules are correctly set can resolve such issues.

These steps are critical for ensuring that the displayed pricing is accurate and consistent, providing a seamless user experience.

Question 3. (Multi Select)

An Architect is documenting the technical design for a single B2C Commerce storefront. The Client has a business requirement to provide pricing that is customized to specific groups:

- 50 different pricing groups of customers
- 30 different pricing groups of employees

- 10 different pricing groups of vendors

Which items should the Architect include in the design in order to set applicable price books based on these requirements"

Choose 2 answers

A: - 50 customer groups for customers- 30 customer groups for employees- 10 customer groups for vendors

B: - One customer group and SO subgroups for customers- One customer group and 30 subgroups for employees- One customer group and 10 subgroups for vendors

C: - One campaign and multiple promotions for each customer group

D: - One promotion and 50 campaigns for customers- One promotion and 30 campaigns for employees- One promotion and 10 campaigns for vendors

Correct Answer: A, C

Explanation:

For handling multiple pricing groups with specific discounts or prices for different customer groups, the optimal approach involves setting up separate customer groups for customers, employees, and vendors (Answer A). This setup allows the storefront to apply specific price books to each group accurately based on their designation. Furthermore, utilizing campaigns and multiple promotions tailored to each customer group (Answer C) facilitates targeted marketing efforts and pricing strategies effectively. These practices ensure that each group receives relevant pricing adjustments and promotional offers, thereby enhancing the shopping experience and managing financial transactions efficiently within Salesforce B2C Commerce.

Question 4. (Single Select)

A developer is checking for Cross Site Scripting (XSS) and found that the quick search is not escaped (allows inclusion of Javascript) in the following script:

```
<script>  
var searchPhrase = '${searchPhrase}';  
</script>
```

How would the developer resolve this issue?

- A: Replace 'with double Quote*
- B: Use <isprint value="\${searchPhrase}* encoding-'jshtml' />
- C: Use <isprint value='\${searchPhrase} encoding-'jsblock' />
- D: Use <toprint value="\${searchPhrase}" />

Correct Answer: B

Explanation:

To resolve the issue of Cross Site Scripting (XSS) where the quick search is not escaped, the developer should use the <isprint> tag with the 'jshtml' encoding option (Answer B). This method ensures that any JavaScript included in the search phrase is properly escaped, preventing the execution of potentially malicious scripts. The 'jshtml' encoding is specifically designed to encode text for HTML contexts where JavaScript is embedded, providing a secure way to handle user input in Salesforce B2C Commerce.

Question 5. (Single Select)

During implementation, the team found that there is a notification controller exposed for an external service that marks the order as paid when notification is received. The notification URL is sent to the service together with the payment request and contains only the URL with orderID as the parameter.

What should the Architect recommend to the team in order to prevent the unauthorized usage of the controller to mark the orders as paid?

- A: Add a customer number in the callback URL and match the customer number against the one stored on the order.

B: Add HTTPS restriction to the controller start node.

C: Add an order token in the callback URL and match the token against the one stored on the order.

D: Add a session attribute and validate it on the callback.

Correct Answer: C

Explanation:

To enhance the security of the notification controller exposed for marking orders as paid, the recommended approach is to add an order-specific token to the callback URL (Answer C). This token should be verified against a stored value on the order to ensure the authenticity and integrity of the payment notification. This method prevents unauthorized use of the controller, as only callbacks containing the correct, order-specific token would be allowed to mark orders as paid. This strategy is essential in maintaining secure and reliable transaction processes within Salesforce B2C Commerce.
